1. Introduction

1.1 Purpose

CampusSafe is a web-based campus security management system designed to provide students, staff, and landlords with a convenient way to report security incidents. The platform enables quick submission of incident reports while providing administrators with a centralized dashboard for monitoring, reviewing, and managing reports. The system aims to promote a safer

campus environment through digital reporting and efficient incident management.

1.2 Scope

CampusSafe provides a secure platform where members of the campus community can report incidents such as theft, assault, robbery, vandalism, fire outbreaks, harassment, and other emergencies. The system stores reports, allows administrators to manage reported cases, and provides statistical information to support security monitoring.

1.3 Objectives

The objectives of CampusSafe are:

- To improve campus security through digital incident reporting.
- To encourage timely reporting of security issues.
- To provide administrators with real-time access to reported incidents.
- To improve communication between the campus community and security personnel.
- To reduce dependence on manual incident reporting.

2. Overall Description

2.1 Product Perspective

CampusSafe is a standalone web application developed using HTML, CSS, and JavaScript. Reports are stored using the browser's Local Storage, making the application lightweight and suitable as an academic prototype without requiring a server or external database.

2.2 Product Functions

The system provides the following functions:

- Submit incident reports.
- Report anonymously.
- Upload supporting evidence.
- View incident statistics.
- Search reports.
- Filter reports.
- Update incident status.
- Delete reports.
- Display administrative dashboard.

2.3 User Classes

Student

Students can:

- Submit incident reports.
- Report anonymously.
- Upload supporting evidence.
- View safety information.

Staff

Staff members can:

- Report security incidents.
- Upload supporting evidence.
- Track submitted reports.

Landlord

Landlords can:

- Report incidents occurring around student residences.
- Upload supporting evidence.
- Assist in improving community security.

Administrator

The administrator is responsible for:

- Viewing all incident reports.
- Searching reports.
- Filtering reports.
- Updating incident status.
- Deleting reports.
- Viewing dashboard statistics.

3. Functional Requirements

FR1 – Home Page

The system shall display:

- Navigation menu
- Hero section
- Services section
- Features section
- Statistics
- Footer

FR2 – Incident Reporting

The system shall allow users to provide:

- Anonymous reporting option
- Full name
- Email address
- Phone number
- Incident category
- Date
- Time
- Location
- Severity level
- Incident description
- Image upload
- Video upload

FR3 – Report Storage

The system shall store incident reports using Local Storage.

FR4 – Dashboard

The administrator dashboard shall display:

- Total reports

- Pending reports
- Resolved reports
- Theft reports
- Complete report table

FR5 – Search Reports

The administrator shall search reports using:

- Incident category
- Incident location

FR6 – Filter Reports

The administrator shall filter reports based on category.

FR7 – Incident Management

The administrator shall:

- Mark incidents as resolved.
- Delete incident reports.

4. Non-Functional Requirements

Performance

- The application shall load quickly.
- Reports shall appear immediately after submission.

- Dashboard statistics shall update automatically.

Reliability

- Reports shall remain stored until deleted.
- Required fields shall be validated before submission.

Security

- Basic client-side validation.
- Administrator authentication can be implemented in future versions.
- Anonymous reporting shall be supported.

Usability

The application shall:

- Be easy to understand.
- Provide a modern and responsive interface.
- Support desktop and mobile devices.

Maintainability

The source code shall be modular, well-structured, and easy to maintain.

Portability

CampusSafe shall operate correctly on:

- Google Chrome
- Microsoft Edge
- Mozilla Firefox
- Opera

5. System Design

Input

The system accepts:

- Full Name
- Email Address
- Phone Number
- Incident Category
- Date
- Time
- Location
- Severity
- Description
- Image

- Video

Processing

The system performs the following operations:

1. The user opens the report form.
2. The user enters incident details.
3. JavaScript validates the information.
4. The report is stored in Local Storage.
5. The dashboard retrieves all reports.
6. Statistics are generated automatically.
7. The administrator manages reported incidents.

Output

The system displays:

- Successful report confirmation.
- Dashboard statistics.
- Report table.
- Search results.
- Filtered reports.
- Updated report status.

6. Object Listing

Object	Description
User	Student, staff member, or landlord reporting an incident
Administrator	System administrator responsible for incident management
Incident Report	Stores information about reported incidents
Dashboard	Displays reports and statistics
Report Form	Collects incident information
Local Storage	Stores reports locally in the browser
Search Module	Searches incident records
Filter Module	Filters reports
Statistics Module	Generates report summaries

7. Future Enhancements

Future versions of CampusSafe may include:

- GPS location tracking.

- Interactive crime map.
- Google Maps integration.
- Email notifications.
- SMS alerts.
- Push notifications.
- User authentication.
- Cloud database integration.
- AI-powered crime trend prediction.
- Mobile application.
- Integration with campus security offices.

8. Conclusion

CampusSafe provides a simple, efficient, and user-friendly platform for reporting and managing security incidents within a campus environment. By allowing students, staff, and landlords to report incidents digitally while enabling administrators to manage reports through a centralized dashboard, the system promotes faster communication and improved campus safety. Although this prototype stores information locally using the

browser's Local Storage, it establishes a solid foundation for future development, including cloud storage, interactive mapping, authentication, and integration with emergency response services.

Functional Requirements Summary

Requirement ID Description

FR1	Display Home Page
FR2	Submit Incident Report
FR3	Store Reports
FR4	Display Dashboard
FR5	Search Reports
FR6	Filter Reports
FR7	Manage Incident Reports

Non-Functional Requirements Summary

Requirement ID Description

NFR1	Fast performance
NFR2	Reliable data storage

Requirement ID Description

NFR3	Basic security and validation
NFR4	User-friendly interface
NFR5	Responsive design
NFR6	Easy maintenance
NFR7	Cross-browser compatibility
